

## Editing soil map ?

Posted by olaf212 - 2010/03/21 06:41

---

Hi,

I'm working on a very small watershed in Europe at high spatial resolution in an area of varying land use and soil types. I need more detailed information than what is provided on FAO soil map.

If I had polygons to the FAO soil map and edit the table manually, will AGWA be able to use it ?

Thanks

Oliver

Hi Oliver,

Yes, you can add/edit polygons in the FAO soil map. If you are only editing polygon boundaries and you use the existing SNUMs in the FAO\_component table, then you won't need to edit any tables.

Additionally,

- If you want to change the percentage of each soil unit that composes an SNUM, then all you need to edit is the FAO\_component table.

- If you want to change the soil units that compose an SNUM, edit the FAO\_component table to change the soil units and make sure the soil units specified for the SNUM appear in both the FAO\_properties and FAO\_summ tables.

There are two approaches to editing the tables. You can edit existing SNUMs and soil units or you can add your own. It really makes no difference as long as the SNUMs that appear in the soil map appear in the FAO\_component table and the soil units for that SNUM appear in the FAO\_properties and FAO\_summ table.

If you have more questions about the tables or about how to do it, just post back.

Shea
